

Ears and Eyes

Without Pictures

Ears and Eyes is a searchable database of cases of physical surveillance devices (microphones, cameras, location trackers...) hidden by law enforcement and intelligence agencies to surveil people or groups engaged in subversive activities.

No Trace Project / No trace, no case. A collection of tools to help anarchists and other rebels **understand** the capabilities of their enemies, **undermine** surveillance efforts, and ultimately **act** without getting caught.

Depending on your context, possession of certain documents may be criminalized or attract unwanted attention—be careful about what zines you print and where you store them.

Unknown location, March 2018

A **surveillance device** was found **inside the desktop phone** of a journalist seemingly targeted for their support to the news organization Wikileaks. The phone, a “Cryptophone” based on the “Snom 870” desktop phone, enabled encrypted voice communications with other Cryptophones. The surveillance device included a battery pack and a shielded module with several electronic components. It was able to record what was said on the phone and could be triggered remotely through radio frequencies to send the recorded data. Components of the phone were modified to install the surveillance device. The device was probably installed by the CIA (Central Intelligence Agency).

United States

Vehicles

Boulder, July 2003

GPS trackers were found under three cars. They were **attached by powerful magnets behind the rear bumpers on the driver's side**. Each one contained a battery pack made of four lithium D cell batteries, a GPS antenna, a cellular antenna and a main component box. The component box contained a GPS receiver, a computer chip and a cellular modem. All the components were wired together. The trackers were probably installed by the FBI (Federal Bureau of Investigation).

About Ears and Eyes

The *Ears and Eyes* project is a searchable database of cases of physical surveillance devices (microphones, cameras, location trackers...) hidden by law enforcement and intelligence agencies to surveil people or groups engaged in subversive activities. Our goal is to help the potential targets of such surveillance practices to better understand and resist them.

Overview

This section provides a brief overview of the surveillance devices included in the database. It is intended to answer common questions you can have about such devices.

When are they installed?

Microphones found inside a power outlet in a building in Bologna, Italy, in January 2018.¹

Hidden physical surveillance devices are typically used by law enforcement and intelligence agencies to obtain information about a target when traditional surveillance methods are insufficient. For example, if a suspect never talks about sensitive topics on the phone—making the monitoring of

their phone useless—law enforcement may resort to installing a hidden microphone in the suspect's home, in the hope of capturing interesting conversations. In many countries, the installation of such devices is regulated by law and must be approved by a judge.

Devices are often installed for long-term surveillance, and may remain in place for weeks, months, or years before being removed or, in some cases, discovered by the people under surveillance. They can also be installed for short-term surveillance of specific events.

Where are they hidden?

Microphones and a GPS tracker found in the fuse box of a car in Lecce, Italy, in December 2017.²

¹<https://notrace.how/earsandeyes/#bologna-2018-01>

²<https://notrace.how/earsandeyes/#lecce-2017-12>

In buildings

Microphones and cameras can be installed in buildings to surveil what goes on inside. Such devices have been found:

- Inside objects: electrical outlets, ceiling lights, air vents, power strips, intercom systems and electric meters.
- Inside furniture: an amplifier, a television, a printer and a kitchen hood.
- Behind walls, ceilings, and floors.

Microphones and cameras can also be installed in buildings close to the actual place under surveillance. Typically, they are installed behind windows so that they can monitor the place under surveillance, its main entrance, or the way leading to it.

In vehicles

Microphones and location trackers can be installed in all types of vehicles: cars, trucks, motorcycles, bicycles, etc. Such devices have been found:

- In parts of vehicles that are accessible from the outside: inside a wheel, in a spare wheel bracket, on a rear bumper, behind a horn grid, behind a battery ventilation grid, or inside a bicycle seat. They are sometimes held in place with magnets.
- Inside vehicles: between a car body and its interior coating, inside a car ceiling, in an interior air vent, inside a car seat head, behind a speedometer or inside a fuse box.

Other

Microphones and cameras can also be installed outdoors. Such devices have been found:

- In urban environments: in streets surrounding places under surveillance, including inside a fake electrical box³ or inside a fake rock.⁴
- In rural environments, hidden in vegetation.

How do they work?

A device equipped with a SIM card found in a vehicle in Italy, in August 2019.⁵

Power supply

Devices require a power supply, which can be either a battery or the electrical system of the building or vehicle in which the device is installed, or both. In rare cases, they may be powered by Power over Ethernet (PoE).

To save battery power and make it harder to detect them, the devices may not be powered on all the time. Some microphones can turn on only when there is sound. Some cameras can use an infrared sensor to turn on only when there is motion. Some location trackers installed on vehicles can turn on only when the vehicle is turned on, or only when it is moving by using a motion sensor.

Data collection

Different devices can collect different kinds of data:

- Microphones can record sound.
- Cameras can record images. Some cameras have infrared vision, allowing them to “see in the dark”.
- Location trackers can record their geographical location. They usually use the Global Positioning System (GPS), allowing them to record their location almost anywhere on the surface of the Earth. In rare cases, devices

in London to surveil Julian Assange, founder of the news organization Wikileaks, which had taken refuge in the embassy since 2012. During this period of time:

- **The interior cameras were replaced with higher resolution cameras equipped with hidden microphones.**
- **Microphones were hidden inside a fire extinguisher and above the storage cabinet in the bathroom used by Assange.**
- **Special stickers were attached on the exterior windows of the embassy** to facilitate the use of a laser microphone (able to capture audio by detecting the sound vibrations in the windows) from a building nearby.
- **A device capable of transmitting in real-time the information collected by the other devices** was installed.

The microphone inside the fire extinguisher was equipped with an SD card and a battery which was changed every twelve hours. The microphone in the bathroom was connected to the electrical system of the building. The devices were installed by the Spanish company Undercover Global, officially in charge of the security at the embassy. Their installation appeared to have been ordered by the CIA (Central Intelligence Agency).

London, April 2018

Several surveillance devices were installed from 2015 to April 2018 in the Ecuadorian embassy

equipped with SIM cards can record their own location by connecting to the mobile phone network and using the cell towers they connect to as geographic references.

Data storage

There are two cases:

- Many devices have internal storage, such as an SD card. This allows them to store the collected data so the spies don't have to continuously retrieve it.
- Some devices have no internal storage. They cannot store the collected data, which must be continuously retrieved by the spies, or it will be lost.

Data retrieval

Data collected by a device must be retrieved by the spies at some point. There are several techniques:

- Most devices are equipped with SIM cards, allowing them to send the collected data over the mobile phone network.
- In rare cases, devices are equipped with radio transmitters, allowing them to send the collected data over arbitrary radio frequencies. This technique requires another device, a receiver, to be nearby to receive the signal—the receiver can be hidden in a building or in a vehicle belonging to the spies.

If a device has internal storage, the spies can retrieve its data by physically accessing it.

How to find them?

A dismantled electrical outlet in which a microphone was found, in Lecco, Italy, in October 2010.⁶

Manual, visual search

The primary technique when searching for bugs in an area is a manual, visual search of the area:

- If you're searching a building, you can use appropriate tools to disassemble electrical outlets, multiple-socket adapters, ceiling lights, and any electrical appliances, looking for anything that shouldn't be there. You can also look inside furniture, basically anywhere a bug might fit.
- If you're searching a vehicle, you can look under the vehicle, inside the wheels, on the rear bumper, behind the vents, looking for anything that shouldn't be there. You can use appropriate tools to dismantle the interior, the ceiling, the dashboard, the seat heads, and so on. On motorcycles or bikes, you can look inside or under the seats. Unlike other vehicles, when searching a bike,⁷ you can determine with a high degree of confidence whether or not a bug is present.
- If you're searching for cameras installed at the windows of buildings on a street, you may be able to see such cameras with binoculars.

⁶<https://notrace.how/earsandeyes/#lecco-2010-10>
⁷<https://notrace.how/threat-library/mitigations/transportation-by-bike.html>

- If you're searching for cameras installed in surveillance vehicles on a street, you can detect such vehicles with passive surveillance detection.⁸

Specialized detection equipment

A secondary technique when searching for bugs is to use specialized detection equipment. Such equipment can be purchased at specialty stores or on the Internet, and includes:

- Radio frequency detectors, to detect devices that are transmitting data on radio frequencies at the time of the search.
- Camera lens detectors to detect cameras.
- Professional equipment—spectrum analyzers, non-linear junction detectors, thermal imaging systems—which can be more effective, but is very expensive and complex to use.

Why to find them?

Searching for bugs in a comprehensive and effective manner requires an extreme degree of technical expertise. If you do not have that expertise, when searching for bugs in an area, you cannot be sure that you have found all the bugs present in the area. Therefore, the purpose of searching for bugs should be to prevent law enforcement and intelligence agencies from gathering information about you, not to consider an area free of covert surveillance devices. Incriminating conversations should always take place outdoors and without electronic devices.⁹

Methodology

To be included in the database, a case must meet the following conditions:

⁸<https://notrace.how/threat-library/mitigations/surveillance-detection.html>

⁹<https://notrace.how/threat-library/mitigations/outdoor-and-device-free-conversations.html>

- A minimum amount of information must be available about the devices, such as where and when they were used, what they looked like, etc. The mere mention of a device in a news article or investigative file is not sufficient.
- The devices must have been installed or operated by a law enforcement or intelligence agency—or by a private company or militia acting as a law enforcement or intelligence agency.
- The devices must have been targeted at individuals or groups engaged in subversive activities. This specifically excludes devices that target government agencies or commercial companies.
- There must be a high likelihood that the case is real and not staged. We assess this likelihood based on our knowledge of how law enforcement and intelligence agencies operate and our experience with subversive networks.

For each case, the following information is provided where possible:

- The type of devices, the location and date they were discovered, and their components.
- Pictures of the devices.
- Additional relevant files, such as user manuals for the devices.
- Sources used to provide this information.

United Kingdom

Vehicles

Northern Ireland, December 1999

A **listening and tracking surveillance device** was found in a car used by Irish republicans. It was **built into the car body in such a way as to make it impossible for anyone carrying out repairs on the vehicle to find it**. It was able to track the location of the vehicle, record and transmit audio, and could be switched on and off remotely. It included a microphone built into the middle of the roof of the vehicle, as well as rechargeable batteries wired to the car that could recharge only when the car was running.

SOURCES

<https://republican-news.org/archive/1999/December09/09bug.html>

County Armagh, Northern Ireland, August 2008

A **GPS tracker** and a **listening device** were found under the car of someone linked to Irish republicans. Parts of the devices were located **under the car bumper**. The listening device used a microphone to transmit conversations within the vehicle over the mobile phone network.

New Zealand

Vehicles

Levin, April 2010

A **GPS tracker** was found under a car. It was **attached to the car with magnets**. It used a mobile phone connection to report the car position. According to the articles that reported the discovery of the tracker, the information it collected was sent to Thompson and Clark, a New Zealand private investigation agency. The surveillance was probably carried out on behalf of a company.

According to the articles that reported the discovery of the tracker, it was supplied to the private investigation agency Thompson and Clark by the New Zealand company **Argus Tracking**. As shown by the high resolution pictures of the device, its model was “GT-2000XT-D”, and it was very similar to the device “GT-2000”, marketed by the company based in United Kingdom **Custodia Systems**.

Buildings

Paris, September 2015

A **surveillance device** was found **in a school located in front of an anarchist library**. It was located **in a storage room on the first floor, overlooking the library through a window**. It looked like a cardboard folder. It was contained in a hard plastic rectangular casing of about 40x25x25 centimeters. It was loud (because of fans) and connected to the electrical network (without batteries). The casing had a hole of about 4 centimeters in diameter for the camera, with three cables coming out at the end, two of which were antennas and a third a small square sensor.

Inside the box were:

- A wireless router with two SIM cards, a GPS module, three cell inputs, and one stereo input.
- A processor.
- A cellular device with a SIM card.
- A camera with two remote-controlled zoom levels.
- And other things that could not be identified.

The device was in place since at least the second week of July 2015.

Paris, April 2022

An **audio surveillance device** was found **in an anarchist library**. The device was hidden **inside the printer-copier of the library**. It included two microphones, an antenna, a transformer, a battery, a small box containing an electronic card, a 64 GB SD card, and a SIM card. According to the article that reported the discovery of the device, it was a surveillance device of model RB800 marketed by the Italian company **Innova**.

Analysis of the SD card revealed that:

- The device was equipped with a “voice activation” function, i.e. it only activated when its microphone picked up a sufficiently high sound level. In the month and a half prior to its discovery, it was activated 2,061 times, with a minimum activation duration of 58 seconds, a maximum duration of 12 hours and an average duration of 10 minutes.

¹⁰<https://notrace.how/earsandeyes/extra-files/paris-2015-09/paris-2015-09.zip>

- When the device was “activated” by the sound level, it transmitted data over the mobile phone network (presumably the audio data captured by its microphone), generally at a rate of a few KB/s, with peaks of 100 KB/s.
- The temperature of the device varied between 14°C and 50°C, with an average of 22°C. Its temperature rose sharply when it was transmitting data.

Sarthe, September 2018

Three outdoor surveillance cameras were found outside, close to the venue of an event. They were located **along a 250m pathway leading to the venue**. Among them, two cameras of model “BOLYGUARD MG983G” were found **laying in the grass** and **in a bush, 80 centimeters above ground** and were covered by a kind of camouflage hairnet. The third camera, of model “RECONYX HYPERFIRE SM750”, was found **on a tree trunk, 1m20 above ground** and had a khaki color.

The contents of the SD cards revealed that:

¹¹<https://notrace.how/earsandeyes/extra-files/paris-2022-04/RB800-en.pdf>

Cuneo, June 2019

A **surveillance device capable of recording images and sound** was found during a gathering in front of a jail. It was located **behind a few stones, in a wall along a path**, wrapped in a black garbage bag. It was not the first time that a gathering took place there. The device contained a battery, a SD card, a microphone, and a camera hidden behind a rock in which a hole had been made. It seemed that the device couldn't send the recorded data, which was stored on the SD card. An analysis of the content of the SD card showed that the device was activated on June 3 and was installed on the afternoon of June 7, the day before the gathering.

The pictures of the device show that the device included a digital video recorder of model “DK-PV500E”, marketed by the Italian company DSE (Digital Surveillance Equipment). This suggests that the device was supplied by the Italian company **DSE**.

Other

Turin, February 2014

Two cameras were found in front of a building. They were hidden **in a fake electric box of the Italian electricity supplier Enel, attached on the first floor of a building**.

The logo of the Italian company Gruppo TRS, which was bought in 2012 by the Italian company Atet, is visible on the pictures of the cameras. This suggests that the cameras were supplied by the Italian company **Atet**.

Genoa, June 2014

Three microphones with cameras were found **in the alleys around a building**. The devices were pointed at the different entries of the building.

The pictures of the devices show that the cameras were marketed by the Italian company Elkron (which became a subsidiary of the Italian company Urmet in 2012). This suggests that the cameras were supplied by the italian company **Elkron**.

SOURCES

http://contropiano.org/news/aggiornamenti-in-breve/italia/2014/06/16/genova-l-occhio-dello-stato-sull-occupazione-di-pellicceria-3-062791

- The cameras were installed on the day they were found, very early in the morning (between 3h30 and 4h)
- They were capable of night vision. Two of them were configured to take pictures and the third one to record video and sound.
- Their positioning allowed them to take pictures of the front and back license plates of cars driving on the pathway, and of people walking on the pathway.
- One of the cameras was useless because of leaves in its field of vision.

The cameras were marketed by the companies **RECONYX** and **Boly**.

Berlin, November 2020

A GPS tracker and a microphone were found in a car. The two devices were installed separately, each in one of the front seat headrests. The headrests were opened and glued back together after the devices were installed. Each device was equipped with two batteries. The first device, which was apparently the control unit, was equipped with a GSM module to send GPS data and recorded audio files via the mobile phone network. On the control unit were a GPS/GSM antenna, the connection to the bat-

¹⁷https://notrace.how/earsandeyes/extra-files/stuttgart-2013-06/GPRSpack.pdf

teries and a microphone. Inside the device, a SIM card was found. The second device seemed to be the actual audio monitoring device. It also had a battery connection, a smaller antenna and two microphones, which had been glued into the holes for the seat support, with anti-vibration padding. This device was equipped with an SD card, but there were no more audio files stored in it. The SD card was apparently used as a storage medium for the operating system data and for temporary storage of the recorded data. According to what was known at the time of discovery, the GPS tracker was installed in August 2019 and the listening device in or after September 2019. The devices were presumably installed by the BKA (Bundeskriminalamt, Federal Criminal Police Office).

SOURCES

https://kontrapolis.info/823

Leipzig, November 2021

A GPS tracker and an audio recording device were found in a car. They were located behind a panel of the front ceiling light. They were connected by a power cable and drew their power from the supply line to the rear ceiling light. The GPS tracker contained, among other things, a GPS receiver “u-blox MAX-M8”, a card slot with a 16 GB microSD card, a cellular chip “u-blox LISA-U230” along with a SIM card, as well as a removable three-pin antenna module. The audio recording device contained a voltage converter, a 3.7 V, 550 mAh lithium-ion battery, and a small circuit board which included a 32 GB microSD card and the “NN01-104” antenna from the company Ignion (formerly “Fractus”). The audio recording device tapped into the microphone of the hands-free system, which was located behind a cover above the rearview mirror.

SOURCES

https://de.indymedia.org/node/160385

Berlin, August 2022

Two GPS trackers were found under a vehicle—the second one was found a few days after the first one was found and removed. They were attached with strong magnets in a hollow space between the bumper's plastic covering and the vehicle body, precisely behind the left rear wheel. Each tracker consisted of two metal cases connected by a cable. The first one contained a battery pack and the second one the tracker itself, including a smaller battery, two antennas, and a SIM card.

The pictures of the device show it included a tracker of model “NavKos T” marketed by the German company DESAG Telematic. This suggests that the device was supplied by the German company DESAG Telematic.

Bologna, July 2007

Two receiver cases were found in the entry corridor of a building. They were hidden **above a fake ceiling in the entry corridor**. They were connected to the phone line with telephone wires. They consisted in a main unit with a remote-controlled connector, a digital receiver showing the strength of the received signal, and antennas. The presence of the two receivers presumably meant that there were two emitting microphones in the building.

Leipzig, March 2014

A **video surveillance device** was found. It was located **on the second floor of a vacant house**. It contained a swiveling camera which was connected to a hard disk and could be controlled via an LTE mobile phone connection, and a battery to power the device. Through a window, the camera had a view of the sidewalk, several building entrances and several apartment windows. The device could not be seen from the outside as its luminous diodes had been masked off.

Bremen, December 2022

Three surveillance cameras were found in a building, pointed towards the entrance of a *wagenplatz* (a leftist political community where people live in trailers). They were located **in a locked room, on the sixth floor of a building close to the wagenplatz**—the building in question was vacant except

for its first floor. One of the cameras was a “Sony ISO 409600 Extreme Sensitivity 4K” with a high-grade “Sony SEL 600mm F4 GM OSS E-mount” telephoto lens. The two other cameras were “Panasonic WV-S6131” IP cameras.

All three cameras were connected to a “G-ST 500+/8R Gscope055” video management device marketed by the German company Geutebrück, which was equipped with a SIM card and a 2 TB SSD. The SSD contained video files dated from November and December 2022 in the GBF (Geutebrück Backup File) format, which can only be opened with the company's proprietary software. There were three files per day, each of which could be assigned to a camera. The file sizes indicated long-term and continuous video surveillance.

Another drive located in the room (a “Samsung Portable SSD T5”) contained additional GBF video files dated from September and October 2022, as well as two images taken by the IP cameras dated from August 2022 and showing the entrance of the *wagenplatz*, people and vehicles.

The whole installation was powered from a wall socket using an “Antrax SwitchBox-GSM” device which contained another SIM card, seemingly allowing the installation to be powered on and off through the mobile phone network. The IP cameras were powered by the video management device through Ethernet (using a “Delock Gigabit PoE+ Splitter” device).

Other

Bavaria, November 2022

A **camera and a microphone** were found on a bike. They were hidden **under the bike seat, inside a container resembling a tool kit**. The device con-

sisted of a main unit connected to a camera, a microphone, a battery (Li-ion, 3.7 V, 60 Wh, 16.0 Ah), a modem (EM7565 Sierra Wireless), a SIM card, a GSM antenna and a 4G antenna (Antenova SR4L002). The camera pointed outwards through a very small hole and was directed at the entrance of the building under surveillance—it was impossible to identify it with the naked eye. A few minutes after the device was spotted and removed, the suspected spies came to retrieve the bike.

Bologna, January 2018

Two microphones and a GPS tracker were found in a car. There was also a device equipped with an antenna, a SIM card and a 16 GB memory card. The microphones were located **under the upholstery of the car roof** and the wires reached the power supply **through the car door**. The power cable was **connected to the fuse box** and to other wires located **under the dashboard**. The magnetized GPS and a thing with an antenna and cards were hidden **behind the speedometer**. Everything had been seemingly installed in the car more than a year before the discovery and the microphones were recording even when the car engine was turned off, in a radius of several meters.

Cagliari, October 2018

Two microphones and a GPS tracker were found in a car. The microphones were located **above the driver's head, next to the junction of the car roof upholstery and the windscreen**. The GPS tracker was located **in the fuse box**. Everything was powered by a connection to the headlights cable. The headlights were dysfunctional, seemingly because of the power supply required by the devices.

Milan, September 2012

A **listening and geolocation device** was found **on a scooter**. It was located **in the spare wheel bracket, next to the tank and behind the horn grid**. It was based on a device sold by Telit (an Italian supplier of wireless technologies). The device model was “Telit GM862-GPS”. It was capable of listening with a microphone, geolocating with a GPS antenna, and transmitting the collected information on the mobile phone network with a GSM antenna. The device was located in the spot where the tank is along with a transformer and an accumulator. Both antennas (GPS and GSM) were connected to the device and ended up in the spare wheel bracket. The microphone, also connected to the device, ended up behind the horn grid. Wires connected the device to the scooter starting system. All these components were attached to the scooter frame by strong magnets secured by tape. This scooter model doesn't have a battery (it dates back to the 1980s) and its engine generates alternating current, hence the presence of a transformer and an accumulator to power the device even when the scooter was not moving.

Bologna, June 2009

A **GPS tracker and microphones** were found in a car. The device was located **in a plastic container (badly) stuck under the roof**. It contained two boxes, both of which included a SIM card. From there wires went out, through a hole, up to under the back seats. There were two microphones along the seat belt canal: the first at the driver's height, the second at the height of the levers used to adjust the seat, next to the back seats. The antenna was behind the back seat. Finally, still coming from these two boxes, a wire went through the car doors to reach the car fuse box.
